ELECTRON MICROSCOPICAL STUDY OF THE STRUCTURE OF ASPHALT. [1960] [11]p. (11 figs. omitted) 20 refs.

Order from SLA ml\$2.40, ph\$3.30 61-10494

Trans. of Erdöl und Kohle (West Germany) 1958, v. 11 [no. 1] p. 13-18.

The colloidal structure of asphalt samples was investigated through electron microscope pictures of metal replicas. Plates were prepared by dissolving an asphalt sample (or, occasionally, melting the asphalt without a solvent), then treating with gold-aluminum vapors to create a replica of the asphalt surface, which is then photographed. [The omitted] figures show variations in surface structure of asphalts in sol state, in gel state and in transition states. Chemical and rheological data were employed to check the results. (Author)

DESCRIPTORS: *Arc welding, *Arc welds, *Hydrogen,
*Porosity.

The paper examines experimental data on the formation
of pores, and the most important technological and
metallurgical factors. It shows the part played by hy-
drogen as the main cause of porosity, as well as the
part played by nitrogen, carbon monoxide and water
vapour. A theoretical analysis is given of the processes
in the gas phase, the weld pool and in the slag which
lead to the appearance of pores; methods of preventing
